

Specification: Vault™ Telecommunication Cable Guide model _____ is made of welded galvanized steel with heavy duty support roller made of polycarbonate resin. Used in conjunction with the Vault™ Housing and curb, it is designed for conduit with fiber optic cables in order to maintain low profile on roof and provide watertight penetration through the roof. The single installation of this product eliminates the costly leak repairs associated with individual penetrations and allows the contractor to pull multiple fiber optic lines to be ran without the use of the long radius elbows associated with conduit fittings.

Note: Factory engineering required for proper radius
It is important to maintain proper radius for fiber optic cables.
